Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that neither the admitted prior art nor Kai teach measuring an output power of the receiving oscillator as required by claim 32.

The argument is not convincing because according to the specification, the "output power" measurement of the receiving oscillator is simply the measurement signal sm(t), preferably produced by mixing the reception and oscillator signals in a mixer (page 12, line 25- page 13, line 10; page 15, lines 4-23). The prior art of Figure 4 (MIX) and Kai (9) each disclose such a mixer. This understanding of the invention was set forth in the office action mailed 12/16/2008 (page 8) and has not been disputed by Applicant.
